

Cloud Enabled OpenVPN Client Setup Guide

vpn.everyone@gmail.com

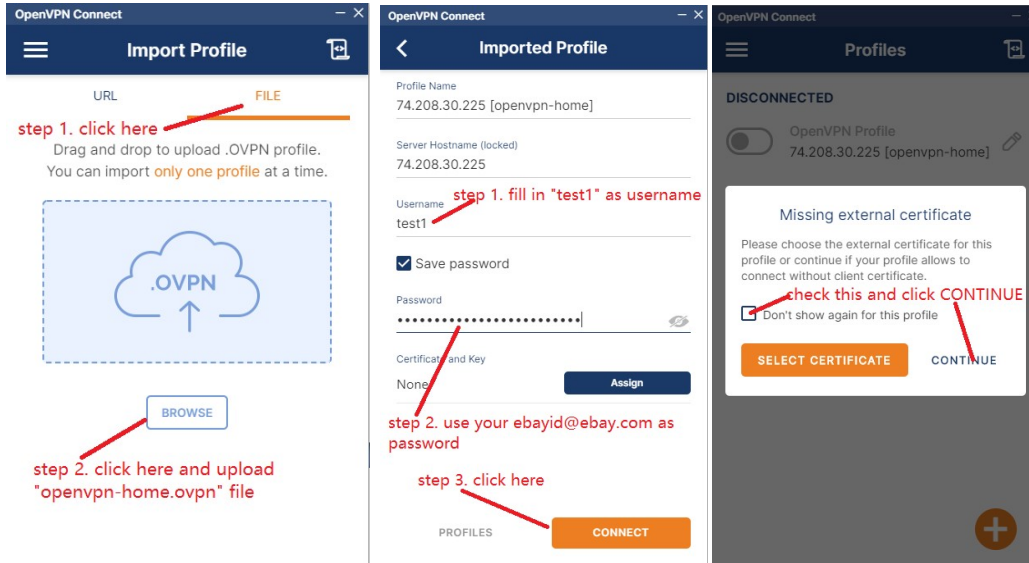

1. Plug the Cloud-enabled OpenVPN server device in your router via Ethernet cable. Power it up.
2. Use your smart phone or PC to search for WiFi network “*vpneveryone.ddns.net*”. Then connect to it with password **00000000** (eight zeros)
3. Start a web browser and access OpenVPN server device by URL <http://192.168.10.1> Login with username **admin** and password **vpneveryone**
4. Go to VPN tab of web UI. Expect to see “**Established**” in “**IPsec VPN Tunnels**” section. It means it successfully connected to our cloud.

5. Click “**VPN Client Profile**”, then Right Click on [openvpn-home.ovpn](#) and then click “**Save link as...**”. Save it in a file.

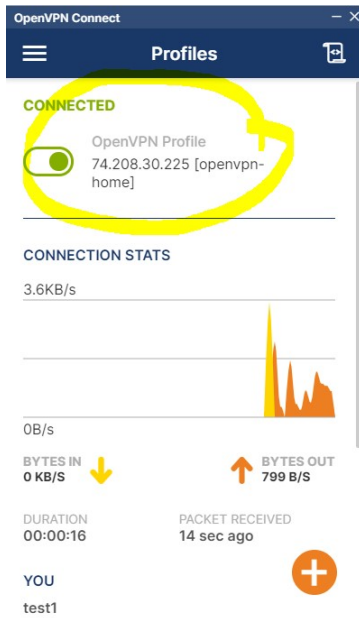

- For PC, macBook, iphone & android phone, install “**OpenVPN Connect**” app.
- Run “**OpenVPN Connect**” app, and follow the screenshots below.

Note: There are 5 username & password pairs preconfigured (**test1, test2, test3, test4, test5**). They have the same initial password. If you give us your email, the password would be your email address. Otherwise, the password is your actual ebayID plus “@ebay.com” without quote sign.

- You successfully connected to your VPN server wherever you plugged in.

PS: We also have mini VPN-WiFi router to work with this OpenVPN server. It is perfect for WiFi enabled device that cannot install VPN client (e.g. smart TV).
